Laparoscopic surgery for ovarian cancer: limits and potentials

It is with great pleasure that we present the current special issue ‘Laparoscopic surgery for ovarian cancer: limits and potentials’. The special issue through surgical technique articles shows many aspects of ovarian cancer treatment. Different laparoscopic approaches have been described including classic laparoscopy, mini-laparoscopy, and robotic surgery. Moreover, some major minimally invasive surgery complications have been shown, such as vascular complication during staging lymphadenectomy for early-stage ovarian cancer patient. Finally, the role of laparoscopic surgery in isolated recurrence treatment of ovarian cancer has also been addressed.

We hope that the articles are exhaustive in satisfying the reader's curiosity and that the minimally invasive surgery in the treatment of ovarian cancer patients is through this special issue extended to new therapeutic options.
